

Task-5

1) Ethical concern of DS: Accountability:

* Accountability is a key ethical concern in data science, referring to the responsibility for the decisions made by data-driven systems.

* Accountability in data science means taking responsibility for decisions made by computers and robots, sometimes it uses data to make choices, like if someone should get a loan or doctor should give a patient medicine. If the machine makes a mistake, it's important to know who is responsible for fixing this.

For ex: If someone who applied for a loan gets rejected because of wrong info, someone should step up and make sure the mistake is corrected. This is why it's important to have clear rules about who is responsible.
